## Homework One

A Graphical User Interface allows people to interact with electronics. An example of this is apps on someone's phone. The icons aren't the app, but they tell our phone to open the app once we click on them. They don't use text-based indicators to run code. Command-line Interfaces use text-based hands. CLIs are the lines of code that run all the programs we use. We use CLIs to manage folders, run programs, and much more. CLIs provide more information and control for the user. GUIs don't allow for much control and are simple versions of CLIs. When coding it's better to use CLIs because the process to learn code can be difficult, but provides so many more options in future projects.
